This sequence has been validated by Multiple Complete Digest
Mapping. Comparison of the experimentally derived map digest
fragments with sequence-predicted fragments is given below.
Small fragments below a variable cutoff (approximately 400-600bp)
are not mapped and hence do not appear in the table. There are no
significant remaining discrepancies between the experimental and
predicted values. Uniquely ordered fragment groups are separated
by dashed lines.

This entry has been annotated with sequence quality
estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero.
Quality levels above 40 are expected to have less than
1 error in 10,000 bp.
Base-by-base quality values are not generally visible from the
GenBank flat file format but are available as part
of this entry's ASN.1 file.
                                                                                                                                                                                                                                                                Direct Submission

Direct Submission

Submitted (22-NOV-1999) Sanger Centre, Hinxton, Cambridgeshire,
CBIO 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk
On Nov 22, 1999 this sequence version replaced gi:613875.

During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlapping clone, as we submit sequences with
only a small overlapping clone, as we submit sequences with
This sequence has been finished according to sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
such as compressions and repeats, but not necessarily within known
annotated human repeat sequence elements (e.g. Alu). Where the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 1. constructed by the Sanger Centre Chromosome 1 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr1
RPI-14409 is from the library RPGT-1 constructed at the Roswell RPAT-14409 is from the library RPGT-1 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpac.med.buffalo.edu/

Mo 63108, USA

On Dec 10, 1999 this sequence version replaced g1:6524275.

Center project name: H_NH0549G13.

* NOTE: This is a "working draft' sequence. It currently toners for a "working draft' sequence. It currently toners from and their order in this sequence record is arbitrary. Gaps between the contigs are represented as truns of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

On Jul 27, 1999 this sequence version replaced gi:5579004.
Outing sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
EMT. SWT. SWTSSPROT, TT., TREMEL, WP., WORWEPP, Information
on the WORWEPP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
has been finished according to sequence map criteria as follows. An
attempt is made to resolve all sequencing problems, such as
compressions and repeats but not necessarily within known
annotated human repeat sequence elements (e.g. Alu), where the
sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .10885,
                                                                            HSJ858BL6 36676 bp DNA PRI 23-NOV-1999
Human DNA sequence from clone 858Bl6 on chromosome 22. Contains the RIANO542 gene and a gene for a novel protein similar to hamster PSSC (Phosphatidylsearine Decarboxylase Proenzyme, EC 4.1.1.65).
Contains ESTs, GSSs and a putative CPG island, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Em: R39 94 Em: A1806913 Em: AA.18770 Em: A88 96285 Em: AA974403 Em: R859 94 Em: A1806913 Em: AA.18770 Em: A88 96285 Em: AA.974403 Em: AA.8594535 Em: AA.859454 Em: A.878947 Em: AA.86947 Em: AA.86947 Em: AA.84866394 Em: AA.8797124 Em: AA.86945 Em: AA.86947 Em: AA.8486657 Em: AA.87975 Em: AA.87797 Em: AA.87797 Em: AA.87975 Em: AA.8

200 Mitchell Drive, Walnut Creek, CA 94598, USA On Oct 31, 1999 this sequence version replaced gi:5686195.

** WOTE: This is a "working draft' sequence. It currently consists of 160 contigs. The true order of the pieces are in of known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are represented as a soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                 * NOTE: This record contains 78 individual
sequencing reads that have not been assembled into
contigs. Runs of N are used to separate the reads
and the order in which they appear is completely
arbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
However, it should not be assumed that this clone
will be sequenced to completion. In the event that
the record is updated, the accession number will
be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         repeat_region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Direct Submission

Direct Submission

Submitted (10-SEP-1999) Sanger Centre, Hinxton, Cambridgeshire,

CB10 1SA, UK. E-mall enquiries: humquery@sanger.ac.uk Clone

requests: clonerequest@sanger.ac.uk

On Jul 27, 1999 this sequence version replaced gi:5579000.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations

together with a note of the overlapping clone name. Note that the

variation annotation may not be found in the sequence submission

only a small overlapping clone, as we submit sequences with

numbers given in the feature table with their source databases:

Em., EMBL; Sw., SMISSPROT; TT., TREMBL; WP., WORNIPEP; Information

on the WORNEPE database can be found at

the entire insert of clone 773A18. This sequence has been finished

according to sequence map criteria as follows. An attempt is made

to resolve all sequencing problems, such as compressions and

repeats, but not necessarily within known annotated human repeat

there is an annotation using the 'unsure' feature kay.

This sequence was generated from part of bacterial clone contigs of

human chromosome 1, constructed by the Sanger Centre Chromosome 1

This sequence was generated from part of bacterial clone

Cancer Institute by the group of Pieter de Jong, For further

details see http://www.sanger.ac.uk/Radpore.med.buffalo.edu/ VECTOR: portPREP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Wew isolated human genes and the secreted polypeptides they encode - useful for diagnosis and treatment of e.g. cancers, neurological disorders, lumnue diseases, inflammation or blood disorders and treatment of e.g. cancers, neurological disorders. Immune diseases, inflammation or blood disorders as Claim 1; Page 180-182; 380pp; English.

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion protein by linking to the gene to a human immunoglobulin Fc portion (e.g. x04030) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: X04311-X04410; amino acid sequences W78125) which are useful for preventing, treating or ameliorating medical conditions can be compared by determining the amount of the new polypeptides: no sample or by determining the presence of mutations in the new polynucleotides.

Specific uses are described for each of the 85 polynucleotides, based on
                                                                                                                                                           Human secreted protein gene 16 clone HSHBQ68.

Human secreted protein gene 16 clone HSHBQ68.

DNA encoding coxsackie virus and adenovirus receptor - useful for modulation of e.g. cardiac, pancreatic or gastrointestinal infection DNA encoding coxsackie virus and adenovirus and elements sequence encodes mouse coxsackievirus and adenovirus creceptor (CAR). The present invention also describes: (1) a method for codulating CAR expression comprising contexting the call with an agent which modulates CAR protein activity or CAR nucleic acid expression, concluding the presence of CAR in a biological sample comprising contacting a biological sample with an agent comprising contacting a biological sample with an agent capable of detecting CAR protein or mans such that the presence of CAR is detected. Comprising contacting a biological sample with an agent capable of detecting CAR protein or mans such that the presence of CAR is detected. Comprising contacting a biological sample with an agent capable of certification of CAR is useful for treatment of cardiac infection of the contral nervous system, e.g. a non-specific febrill illness or infection of central nervous system, e.g. a non-specific febrille illness or infection of the respiratory or gastrointestinal tract or childhood conset diabetes mellitus. Probes derived from CAR nucleic acids are useful for hybridisation assays, and antibodies raised against CAR conset diabetes mellitus. Probes derived from CAR nucleic acids are useful for hybridisation assays, and antibodies raised against CAR include combaining CAR protein and candidate/test compound are useful sequence 1128 Bp; 297 A; 286 C; 288 G; 257 T;

For preventing and treating viral infection and consackievirus B - for preventing and treating viral infection and rendering cells reuseptible to transformation by adenoviral vectors in gene therapy claim 2; Page 68-70; 88pp; English.

This cDNA molecule codes for mouse McAR protein (see W6698) that respect to and for the group B cossackieviruses (CVB). It was obtained by screening a lambda phase expression cDNA library with antiserum containing antibodies specific for mouse CVB binding protein p46, and was used to identify human HCAR CDNA (See V5042). The invention also provides host cells transformed with DNA molecules encoding activities of the scroping at the containing antibodies specific for mouse CVB binding protein p46, and was used to identify human HCAR CDNA (See V5042). The invention also provides host cells transformed with DNA molecules encoding HCAR or MCAR and methods of producing the recombinant proteins or their derivatives. These proteins, their extreaclular domains, as well as oligopeptides (See CMCAR proteins or their fragments or variants are used to prevent or treat virus infections. Expressing the DNA in cells which lack these viral receptors renders the cells susceptible to treat virus infections remains an encode or gene there were the colls which lack the recombination by adenoviral vectors carrying genes for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New gene encoding a radiation protecting checkpoint protein - useful

CHAIM (102964) coding for the mouse cell-cycle requilatory (CCR) protein p15 (R85118) was isolated from an embryonal carcinomal library using a probe based on a mouse CCR p13.5 CDNA (102965). The isolated cDNA can be used: to detect mutations in CCR genes that lead to cell proliferation; to breed transgenic animals to study cellular disorders involving CCR allela
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   V50430 standard; cDNA; 1301 BP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             å
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynocleotides encoding human secreted proteins - derived from e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituliary, retina and colon cDNA libraries (Laim 1; Page 210; 633pp; English.

This sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, activity, hasmatopolesis regulating activity, tissue growth activity, hasmostatic and thrombolytic activity, chemotactic/chemokinetic activity, hasmostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity, The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Expressed sequence tag; secreted protein; haematopolesis regulator; Islasue growth, activin; inhibin; tumour invasion auppressor; EST; human; chemotaxis; chemoXinesis; haemoStasis; gene therapy; thrombolysis; receptor; ligand; anti-inflammatory; tumour inhibitor; ds.
                                                                              A CDNA clone (718856) codes for a novel radiation-protecting human checkpoint protein (84906), designated RAP-1, involved in regulation of cell cycle progression and/or apoptosis. It was isolated from a human CDNA ilbrary established in an immortalised xeroderma pigmentosa cell line, GM2096 (XPIMI). A CDNA (CDNA3) contg. a 46. De insert complemented UV sensitivity and was used to screen a lambda-gtl0-K562 human cDNA ilbrary. The insert represented part of the 3510 bp RAP-1 mRNA. The human checkpoint gene can be used as a marker for early detection and prevention of tumour progression or can be used to design new drugs that enhance radiotherapy or chemotherapy of diseases involving abnormal apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1831 TACCTCCTTGGACTTCTCCAAAGAAAACAAGAAAAAAGGAGGAGGATCTAGTTGGCAGCTT 1890

Claim 13, Page 43; 72pp; English.
The CDNA encodes ApoE4Lx2, a protease catalyzing the formation of the abnormal beta/A4 variant of beta-amyloid protein, which is used to develop an inhibitor for the diagnosis and teatment of Alzheimer disease. Downs syndrome, Parkinson disease, schizophrenia, hyperlipoproteinemia or cardiovascular disease. Sequence 936 BP; 149 A; 317 C; 336 G; 134 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              305 GAGCGCGCCTCAGCGCCATCCGCGAGCGCCTGGGGCCCCTGGTGGAACAGGGCCGCGTG 246

                                                                                                                                                                                                                            New proteinase esterase-like proteins - used to develop prods. for the diagnosis and treatment of Alzheimer's disease and related diseases and treatment of Alzheimer's disease and related diseases as 139; 72pp; English.

The cDNA encodes Apod4L, a protease catalyzing the formation of the abnormal beta/A4 valant of beta-amyloid protein, which is used to develop an inhibitor for the diagnosis and teatment of Alzheimer disease, bowns syndrome, Parkinson diseases, schizophrenia, hyperlipoproteinemia or cardiovascular disease.

The encoded protein is used to treat subjects who are deficient in apolipoprotein-E (or who produce abnormal forms of this molecule) and therefore are likely to suffer from hyperlipidemia, resulting in arteriosclerosis. It can also be used to raise antisera for detecting the protein deficiency or production of abnormal forms. Sequence 1110 BP; 198 A; 354 C; 415 G; 143 T;

DNA which codes human apolipoprotein E for treatment of hyperlipaemia.

Claim 3; Page 484; 8pp; Japanese.

The sequence may be used to produce the apolipoprotein E, useful treatment of hyperlipaemia.

Proteins and nucleic acids associated with Alzheimer's disease -
used to develop products for diagnosis of Alzheimer's disease and
trelated conditions, hyperlipoproteinaemia or cardiovascular disease
T related conditions, hyperlipoproteinaemia or cardiovascular disease
T claim 13, Fig 6A; 67p; English.
C 2 Open reading frames (718068 and 718069) identified in the
apolipoprotein E (ApoE) antisease sequence code for proteins
apoEd. (R92113) and apoEd.11 (R92114), respectively. Both ORRs
C are transcribed from an upstream requiatory region (718074).
C ApoEd comprises 2 alleles, one of Which causes Ed. and Ed.11 to
combine to form a hybrid ORF, ApoEd.x.2 (718070). Elucidation of
the significance of these and other sequences (see also 71805577)
in the actiology of Alzheimer's diseases (AD) provides means for
diagnosing AD and related diseases, for the design of therapeutic
therefore.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             305 GAGCGCGCCTCAGCGCCATCCGCGAGCGCCTGGGGCCCTGGTGGAACAGGGCCGCGTG 246

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Location/Qualifiers
```

```
Prodn. of recombinant apo:lipoprotein E in insects - by infecting Manduca sexta larvae with recombinant Autographica californica nuclear polyhedrosis baculovius vector.

Proclosure; Columns 11-14: lopp: English.

CC Recombinant human apolipoprotein-E (ApoE) (R86791) can be produced by preparing a genetic construct (contg. an ApoE-encoding sequence, e.g. T06957, and flanking regulatory sequences enabling the protein construct construct (contg. an ApoE-encoding sequence, e.g. T06957, and flanking regulatory sequences enabling the protein contger to be expressed in insect cells), which is then introduced into a Manduca sexta larva (using a recombinant Autographica californica nuclear polyhedrosis virus) and recovering the protein from the haemolymph of the larval host. The ApoE produced is in a form cufficiently complexed with lipids to be biologically active, which cannot be achieved in insect cell cultures, and can therefore be used in therpeutic applications.

Squence 1157 BP; 212 A; 370 C; 426 G; 149 T;

/note="Vector: pr773D-pac (Pharmacia) with a modified polylinker; Site_1: Not 1; Site_2: Eco RI; The UI-R-C2p library, which is a subtracted library derived from the UI-R-C1 library, which is a subtracted library derived from the UI-R-C1 library.

UTR-C0 library. The UI-R-C0 library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, 8, 12 and 18-day embryo. The tag is a string of 3- Sucleotides present between the Not I site and the oligo-dr track which allows identification of the library of origin of a clone within the mixture. The subtracted library of origin of a clone within the mixture of the library of origin of a clone within UI-R-C1 clones from which 3' ESTS had been derived was used as a driver in a hybridization with the UI-R-C1 library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DHIOB bacteria (Life Technologies) to generate the UI-R-C2p library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ä
